“Life support-based comprehensive treatment regimen” for the treatment of patients with fulminant myocarditis

Prof. Dr. Daowen Wang and Prof. Dr. Ning Zhou
Departments of Internal Medicine and Institute of Hypertension
Tongji Hospital of HUST, People's Republic of China

Fulminant myocarditis is caused majorly by the infection with various viruses. The mortality is up to 50-70% and treatment options are limited. Prof. Dr. Daowen Wang and Prof. Dr. Ning Zhou discuss clinical diagnosis and management according to the Chinese Society of Cardiology Expert Consensus Statement on the Diagnosis and Treatment of Fulminant Myocarditis, and based on the data of their clinical trial. As part of the consensus, they describe a new approach, a “life support-based comprehensive treatment regimen”. Their experience in multiple cardiac centers indicates that this treatment can dramatically lower the mortality of the patients with fulminant myocarditis.
