Biomarkers in Myocardial Infarction - Novel and Improved Strategies -

Priv. Doz. Dr. med. Dirk Westermann
Department of General and Interventional Cardiology
University Heart Center Hamburg

Measurement of cardiac troponin is essential for diagnosing acute myocardial infarction (AMI) in daily clinical care. Nevertheless, with the help of the high sensitivity assayed troponin a rapid rule-out of AMI seems possible. We will show our data for the BACC study (Biomarkers in acute cardiovascular care) demonstrating rapid rule-out and its influence on the prognosis of patients. Moreover, we will demonstrate new pathways to triage patients with suspected ACS, that will be introduced in the clinic shortly. This will be backed up by the largest RCT in the field of biomarker enabled AMI diagnosis. Finally, we will demonstrate new tools for risk stratification in the general population.
